

**NAME**

CUTEst\_ushp – CUTEst tool to evaluate the sparsity pattern of the Hessian matrix of the objective function.

**SYNOPSIS**

CALL CUTEst\_ushp( status, n, nnzh, lh, H\_row, H\_col )

**DESCRIPTION**

The CUTEst\_ushp subroutine evaluates the sparsity pattern of the Hessian matrix of the objective function of the problem, decoded from a SIF file by the script *sifdecoder*, in coordinate format.

The problem under consideration is to minimize or maximize an objective function  $f(x)$  over all  $x \in R^n$  subject to the simple bounds  $x^l \leq x \leq x^u$ . The objective function is group-partially separable.

**ARGUMENTS**

The arguments of CUTEst\_ushp are as follows

**status** [out] - integer

the output status: 0 for a successful call, 1 for an array allocation/deallocation error, 2 for an array bound error, 3 for an evaluation error,

**n** [in] - integer

the number of variables for the problem,

**nnzh** [out] - integer

the number of nonzero elements in the Hessian matrix,

**lh** [in] - integer

the actual declared dimensions of H\_row and H\_col,

**H\_row** [out] - integer

an array which gives the row indices of the nonzeros of the Hessian matrix of the objective function. Only the upper triangular part of the Hessian is stored,

**H\_col** [out] - integer

an array which gives the column indices of the nonzeros of the Hessian matrix of the objective function corresponding to the row indices in H\_row.
